

Arth — Statements Page Guideline Document

Created: 26 Mar 2026 **Purpose:** Design guideline for the [/statements](#) page — personal financial statements presented in corporate financial statement format.

Context: This is one of three page-level guideline documents. The other two are the Holdings Page ([/portfolio](#)) and the Financial Health Dashboard ([/health](#)). This page provides the analytical "understand your financial structure" view.

1 · Page Purpose

The Statements page answers: **"Help me understand my financial structure."**

It presents the three core financial statements — P&L, Balance Sheet, and Cash Flow — adapted for personal finance. This is the most analytical of the three pages. The user who comes here is thinking like a CFO reviewing their household's books.

The statements are formal, structured tables. Not dashboards, not charts (with one exception on the Balance Sheet tab). Each statement has relevant financial ratios shown alongside it.

2 · Page Structure

Tab-based layout with three tabs:

- **Default period:** Quarterly
 - **Toggle:** Quarterly ↔ Annual
 - **No monthly view** — too short a time frame for financial statements
 - **Ratios** are shown alongside each statement tab (sidebar on desktop), relevant to that statement's domain
-

3 · Tab 1: Personal P&L Statement

3.1 Statement Table

Generated for the selected period (quarter or year). Formatted like a corporate income statement with line items, subtotals, and a bottom line.

Line Item	Description
Total Income	All inflows: salary, bonuses, dividends, rental income, side hustle income
Less: Taxes paid	Tax-related outflows
Gross Income	Total Income – Taxes
Less: Fixed expenses	EMIs, insurance premiums, rent — recurring, non-discretionary
Less: Variable essentials	Groceries, utilities, transport — necessary but variable
Less: Discretionary	Dining, hobbies, travel, entertainment, shopping
Operating Surplus	Gross Income – All Expenses
Less: Loan interest component	Interest portion of EMIs (computed from liabilities)
Net Surplus	What actually gets added to net worth

Comparison columns (when data permits):

- Current period vs. previous period
- Current period vs. same period last year (once 12+ months of data exist)

3.2 P&L Ratios (alongside)

Ratio	Formula	Display
Savings Rate vs. Required	Net surplus ÷ gross income, compared to goal-derived requirement	Number + sparkline (quarterly trend) + % change from prior period
Needs:Wants Ratio	Essential spend ÷ discretionary spend	Number + sparkline + % change
Expense Efficiency	Fixed expenses ÷ total expenses	Number + sparkline + % change

Each ratio shows:

- The current period's value
- A small sparkline showing the trend over the last 4-6 periods
- Percentage change from the prior period (↑ or ↓ with green/red coloring where directionally meaningful)

4 · Tab 2: Personal Balance Sheet

4.1 Statement Table

Point-in-time snapshot as of the end of the selected period. The balance sheet must actually **balance**: Assets = Liabilities + Net Worth.

ASSETS

Current Assets (liquid)	₹XX
Cash & savings accounts	
Liquid mutual funds	
(Holdings where liquidity_class = INSTANT or T_PLUS_1)	
Non-Current Assets (illiquid)	₹XX
Equities, equity MFs, FDs, PPF, NPS, gold, SGBs, real estate	
(Holdings where liquidity_class > T_PLUS_1)	

Total Assets	₹XX
--------------	-----

LIABILITIES

Current Liabilities	₹XX
CC dues, EMIs due within 12 months	

Non-Current Liabilities	₹XX
Remaining loan principal beyond 12 months	

Total Liabilities	₹XX
-------------------	-----

NET WORTH (EQUITY)

Contributed Capital	₹XX
---------------------	-----

- Total amount invested from income over lifetime
- Sum of all purchase amounts at cost basis
- Analogous to corporate "paid-in capital"

Retained Gains	₹XX
----------------	-----

- Total appreciation, returns, interest, dividends reinvested
- Current portfolio value minus total cost basis
- Analogous to corporate "retained earnings"

Breakdown:

Realized Gains	₹XX
Unrealized Gains	₹XX

Total Net Worth	₹XX
-----------------	-----

Total Assets = Total Liabilities + Total Net Worth ✓ BALANCED

Why the equity breakdown matters: It answers "how much of my wealth came from my labor vs. my capital?" If contributed capital is ₹30L and retained gains are ₹8L, then 79% of wealth is from effort and 21% from investments working. Over time, you want the gains share to grow — that's the path to financial independence.

Comparison columns (when data permits):

- Current quarter-end vs. previous quarter-end
- Current quarter-end vs. same quarter last year

4.2 Net Worth Visualization

The one exception to "no charts on this page." These two views sit below the balance sheet table on this tab.

Current Snapshot — Waterfall Chart:

- Shows the building blocks: Contributed Capital → + Retained Gains → = Total Assets →
- Liabilities → = Net Worth

- Each block is a different color, amounts labeled
- Insight line below: "X% of your net worth comes from what you saved. Y% from what your money earned."

Quarterly Trend — Stacked Bar Chart:

- Toggle between the waterfall (snapshot) and stacked bars (trend)
- Quarterly data points
- Bottom stack: Contributed Capital. Top stack: Retained Gains. Below axis: Liabilities (negative)
- **Key label:** gains percentage shown at the top of each bar (e.g., "18%", "21%", "27%")
- This tracks the shift from labor-driven to capital-driven wealth over time

4.3 Balance Sheet Ratios (alongside)

Ratio	Formula	Display
Capital Contribution Ratio	Retained gains ÷ total net worth	Number + sparkline + % change
Debt-to-Asset	Total liabilities ÷ total assets	Number + sparkline + % change
Portfolio XIRR vs. Goal Required Return	Actual blended portfolio return vs. what goals need	Number + sparkline + % change

5 · Tab 3: Personal Cash Flow Statement

5.1 Statement Table

Generated for the selected period (quarter or year). Follows the standard three-section format.

Section	Line Items	Source
Operating Cash Flow		
	Net income (from P&L)	Transactions
	Adjustments for non-cash items	If applicable
	Net Operating Cash Flow	Income minus expenses for the period
Investing Cash Flow		
	Asset purchases (stocks, MFs, FDs, etc.)	<code>investment_transactions</code> (BUY, SIP)
	Asset sales / redemptions	<code>investment_transactions</code> (SELL)
	Net Investing Cash Flow	Purchases minus sales
Financing Cash Flow		
	Loan drawdowns	New loans taken
	Principal repayments	EMI principal component from <code>liabilities</code>
	Net Financing Cash Flow	Drawdowns minus repayments
Net Cash Flow	Sum of all three sections	Change in cash/bank balance for the period

Comparison columns (when data permits):

- Current period vs. previous period

5.2 Cash Flow Ratios (alongside)

Ratio	Formula	Display
-------	---------	---------

Cash Runway	Liquid assets ÷ monthly core expenses	Number + sparkline + % change
Debt Service Coverage	Monthly income ÷ monthly fixed obligations	Number + sparkline + % change
Liquidity Ratio	Liquid assets ÷ current liabilities	Number + sparkline + % change
Goal Velocity	Actual monthly progress ÷ required monthly progress (blended across goals)	Number + sparkline + % change

6 · Ratio Display Format

All ratios across all three tabs follow the same compact format:

Savings Rate vs. Required		
42%		↑ 3.2%
(sparkline)	(vs prior)	
Needs:Wants Ratio		
1.8		↓ 5.1%
(sparkline)	(vs prior)	

Each ratio shows:

- **Name** — what the ratio is
- **Current value** — the number for this period
- **Sparkline** — small inline trend line showing the last 4-6 quarterly data points
- **% change** — change from prior period, with ↑/↓ arrow, color-coded green/red where the direction has a clear good/bad interpretation (e.g., savings rate going up = green, debt-to-asset going up = red)

No "healthy/watch" labels — the number, trend, and direction tell the story.

7 · Design Principles

1. **Tables are the primary content.** This is a statements page, not a dashboard. The financial statements themselves are the value. Clean, well-formatted tables with clear line items and subtotals.
 2. **One visualization exception.** The net worth waterfall and quarterly trend on the Balance Sheet tab. This earns its place because it makes the equity breakdown viscerally understandable in a way a table row cannot.
 3. **Ratios are companions, not heroes.** They sit alongside the statements they relate to, providing quick analytical context. They don't dominate the page.
 4. **Quarterly is the right cadence.** Financial statements are meaningful at quarterly and annual granularity. Monthly is too noisy for structural analysis.
 5. **Comparison tells the story.** Where possible, show this period vs. last period. The absolute numbers are less interesting than the direction of change.
 6. **Formal but not dry.** Use corporate financial statement formatting (line items, subtotals, indentation) but in a clean, modern web layout — not a photocopy of an annual report.
-

This document is standalone and covers only the Statements page (</statements>). Separate guideline documents exist for the Holdings Page (</portfolio>) and the Financial Health Dashboard (</health>).
